## Q Clear Laser Treatment for Fungal Nails: THE PROCESS

Because there are many causes for discoloration, deformity, and thickness of toenails, a brief visit ( 15 min) with Dr. Condon is required before any Laser treatment is performed. Please remove all nail polish before this visit. This visit is specific for toenail assessment. (If you have other foot issues you wish to discuss, please inform the staff while scheduling your appointment, so we can spend the amount of time you deserve to evaluate your problems.) During this visit, Dr Condon will examine your toenails and take a brief but specific history with regards to your nail health and history. If he suspects the nail or nails in question are infected with fungus, he will suggest a sample of nail be submitted for a PAS stain. The results, which take a little over a week, will validate or refute whether the nail is a candidate for Laser treatment. This office visit and PAS sample test are typically covered by insurance and we will be happy to submit these for you.

The Laser Treatment: We ask that you arrive with all paint or lacquer removed from your nails. Please bring a clean pair of socks with you for after the treatment. The procedure itself is expected to be painless, although some patients may experience a warming sensation of their nails. Please let Dr. Condon know if you experience pain or discomfort. Depending on the number of toenails being treated, the Laser treatment session will last 10-30 minutes. For your safety, you will be wearing goggles during the treatment. Due to safety concerns, no one can accompany you during the treatment. There is no post procedure pain to be expected.

The outcome: The Q Clear laser is FDA approved for the temporary clearing of nails..... Read on. Since fungal infections are common on feet there is a chance of recurrence; therefore the wording “ temporary clearing of nails”. Using the Q Clear Laser, we expect that most nails will show good results with only one treatment. Extremely thick or discolored nails may pose to be more stubborn and additional treatment may be required. Post Laser treatment, Dr. Condon will provide you with strategies and suggested protocols to help prevent reinfection. If you are like most patients, you should expect a gradual clearing of the nail as the nail grows out. The nail grows out from the cuticle, therefore new nail growth should be healthier. We suggest an appointment 3 months after the procedure to gauge your progress. If you should have questions please contact us at 530 587 4266 or email us [trucketahoepodiatry@yahoo.com](mailto:trucketahoepodiatry@yahoo.com). Presently, Laser Nail treatments are only performed in the Truckee office.
